DETAILED ACTION

Allowable Subject Matter

1. Claims 1-15, are allowed.

The following is an examiner's statement of reasons for allowance:

Regarding claims 1, 6, 9, 12, the present application teaches a roaming service method for a fast and secure wireless network is provided. In an embodiment of the present invention, an AP, which an STA associates with, transmits proactive keys needed for roaming to neighbor APs of the AP. When the STA moves to one of the neighbor APs, a reassociation is carried out between the STA and the neighbor AP using the already provided proactive key. In another embodiment of the present invention, an authentication server transmits proactive keys needed for roaming to neighbor APs to which the STA is likely to move, so that when the STA moves to one of the neighbor APs, a re-association is carried out between the STA and the neighbor AP using the already provided proactive key as specifically mentioned on claims 1, 6, 9, 12.

The closest such as Mejer et al. (US Publication 2004/0103282 A1) teaches a method and system for handling roaming mobile nodes in a wireless network. The system uses a Subnet Context Manager to store current Network session keys, security policy and duration of the session (e.g. session timeout) for mobile nodes, which is

established when the mobile node is initially authenticated. Pairwise transit keys are derived from the network session key. The Subnet Context Manager handles subsequent re-association requests. When a mobile node roams to a new access point, the access point obtains the network session key from the Subnet Context Manager and validates the mobile node by computing a new pairwise transient key from the network session key. Mejer fails to teach a roaming service method for a fast and secure wireless network is provided, wherein AP, associated with an STA transmits proactive keys needed for roaming to neighbor APs of the AP. When the STA moves to one of the neighbor APs, a re-association is carried out between the STA and the neighbor AP using the already provided proactive key. Mejer does not teach an authentication server transmits proactive keys needed for roaming to neighbor APs to which the STA is likely to move, so that when the STA moves to one of the neighbor APs, a re-association is carried out between the STA and the neighbor AP using the already provided proactive key as specifically mentioned on claims 1, 6, 9, 12.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
